

Concourse

Product Engineer

Full-time On-site New York \$140K - \$170K

About this role

Why join us

- We're a 9-month-old, fast-growing startup building cutting-edge AI software for state and local governments.
- Backed by Bessemer Venture Partners and led by a repeat founder with a successful exit.
- Small, tight-knit team of 6 in NYC, already seeing strong revenue traction.
- You'll be the person who helps deliver our products from ideation, to demo, to production.
- A rare ground-floor opportunity to improve how government actually works, not in theory but in practice.

About the role

We're looking for an **Engineer** who can do two things exceptionally well:

1. **Build user-friendly, reliable software for government officials** – work closely with our government partners to develop and implement software that replaces legacy, hidebound mainframe and pen-and-paper systems.
2. **Own internal tooling** – design and maintain the internal systems that orchestrate long, back-to-back AI pipelines and agents across tasks and users.

You'll work directly with the founder and early team to build both the **internal engine** that powers our AI workflows and the **customer-facing demos&deliveries** that help governments understand what's possible.

We're very open on tenure: all that matters is that you are excited to build, experiment, and grow as the role grows. There are opportunities to be more forward-deployed and client-facing over time.

You might be a fit if you are

Very entrepreneurial

- You think like a founder: "What is the ACTUAL product need here?"

- You're comfortable with ambiguity and can self-direct without a fully specced ticket
- You like talking to non-technical users (gov folks, ops teams) and translating messy workflows into simple software

Very fast at building

- You are genuinely quick with all resources at your disposal. AI + an hour + your incoming knowledge is all you need to get from 0 to 80%
- You care about demo-feedback loops: basic UX, narrative flow, sample data, and edge-case handling at first; with feedback to build on
- You're comfortable cutting scope ruthlessly and building back up to full product needs

Very ops-oriented

- You think in terms of systems: queues, retries, monitoring, “what happens when this runs 1,000 times a day across 20 customers?”
- You're excited by the challenge of running AI pipelines with many humans in the loop—support, analysts, case workers, etc.
- You enjoy building internal tools as much as external-facing features.

What we're looking for

Must-haves (for full-time)

- Project history – what have you built in a vacuum?
- Strong fluency in **Backend** (Python and/or Node) and modern **Frontend** development (React, TailwindCSS, or similar)
- Hands-on experience using AI coding tools (Claude Code, Factory, Codex, Gemini-CLI, etc.) as part of your workflow.
- Comfort spinning up small full-stack apps: API, data model, simple UI, deployment.
- US work authorization; **US citizen**
- Willingness to work **in-person in Flatiron, NYC (5 days/week)**.

Nice-to-haves

- Experience at a startup or as a founder / founding engineer.
- Familiarity with long-running workflows, background workers, queues, or “agentic” AI orchestration.
- Comfort talking to customers and sitting in on live demos.

What this role is *not*

- This is **not** a pure front-end role. You should be comfortable owning full-stack demos and internal tools.
- This is **not** a big-company engineering job with long roadmaps and narrow scopes. You'll be context-switching between products, domains, and codebases not just

weekly but daily + hourly. You should enjoy playing whac-a-mole.

0+ years of experience

in full-stack engineering, building and owning projects end-to-end

Salary

\$140K - \$170K

Equity

Up to 0.50% of equity

Visa sponsorship not available

No visa sponsorship

On-site work policy

5 days in-office in Flatiron, NYC

Full-time position

Location

New York

Next.js, Python, Tailwind CSS

About Concourse

- Concourse is an early-stage, fast-growing startup backed by Bessemer Venture Partners, the CEO's second venture after a successful exit in 2021
- The company sells technology to state and local governments, aiming to improve public services by replacing legacy, inefficient systems
- The core problem they address is the disconnect between tax payments and perceived government inefficiency, often due to outdated technology
- They are building an AI-native company where every team member is empowered to use AI tools like Claude code to automate their work
